

## Distributed model for Trace Compass

Quoc-Hao Tran Friday 28 January 2022

## Agenda

O Background & challenges

- O2 Proposed solution
- O3 Future work

## Trace Compass current architecture

Trace Server Protocol (TSP)

Client (Eclipse, Theia extension,...etc.)

## Use case & current limitations

## Distributed model for Trace Compass

## Prototype with 2 views

#### 1/ Statistics

- Multi-pass
- Simple aggregator

_evel 👻	Events total	Events in selecti	d Global
🗸 🚨 pacman		9 3	syscall_exit_newstat
🕶 🗁 Event Types			syscall_entry_newstat
🔝 block_rq_complete	0.1% 94		b syscall_entry_read
🔝 block_rq_insert			D Systan_exit_read
🐷 block_rq_issue			D gg
🔝 irq_handler_entry	0.1 % 16		D syscall_entry_rt_sigaction
🔝 irq_handler_exit	0.1 % 16		D syscall_exit_rt_sigaction
irg softirg entry	1.6 % 1,35		0 Others

#### 2/ CPU usage

- Single-pass
- Complex aggregator

## Query in details

## Aggregator example

For (entry, i) in list 1

If isEqual(entry,list 2 [i]) { // best case

Final list [i] = sum/average/min/max

}else // worst case

Iterate list 2 until isEqual(entry,list 2 [j])

End for

event/process 1	1 unit	
event/process 2	2 unit	
event/process 3	3 unit	
event/process 2	2 unit	
event/process 1	1 unit	
event/process 3	3 unit	

## Benchmarks (implemented in NodeJS)

- 2 trace server nodes (Intel Xeon E5640 16 cores, 192gb memory
- 20 traces, each trace range 100mb ~ 1gb (10 traces each trace server)
- Best-case (cloned traces) vs worst-case (different traces)

Best-case

Worst-case

Type of analysis	Gain	Type of analysis	Gain
Statistics	1.7x	Statistics	1.67x
CPU usage (XY)	1.57x	CPU usage (XY)	1.33x

Gain = Parallel portion / nodes - network overhead - aggregator overhead

## Future work

- Define aggregators algorithm for other types of analyses using a suitable language
- Define use cases for query state machine
- Formulate network & aggregators overheads
- Measure memory footprint
- Implement the model using well-defined analysis frameworks (e.g Spark)
- To be tested on real-world target:
  - GPU cluster
  - MPI cluster

## Conclusion

- Pattern for parallel computation of Trace Compass
- Define communication pattern between trace servers and coordinator
- Mini-framework for implementing trace coordinator

# Thank you for listening
